                                                                                                                                                                                                                                                                                                                                                                                                                     Therefore to human inducible nitric oxide synthase - using an Detection of human inducible nitric oxide synthase - using an Influencessay in which a sample is contacted with a specific binding entity reactive with human iNOS or mimics.

Example 13; Page 55; 93pp; English.

This invention describes an immunosasay method where a sample with a specific binding entity (e.g. a monoclonal antibody) reactive to human inducible nitric oxide synthase (iNOS) or mimics of this protein is used to detect the presence of human iNOS protein in the sample. The method can be used for the detection and quantitation of human iNOS in cells and tissues for various pathophysiclogical conditions such as sepsis, septic shock, myocardial infarction, rejection of tissue in organs following transplantation, monitoring "flare ups" in certain autoimnume diseases such as lupus, psoriasis, and multiple sclerosis. This sequence represents a peptide from human iNOS which is used in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Detection of human inducible nitric oxide synthase - using an immunoassay in which a sample is contacted with a specific binding entity reactive with human iNOS or minics.

Example 13: Page 55: 93p; English.

This invention describes an immunoassay method where a sample with a specific binding entity (e.g. a monoclonal antibody) reactive to human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                30-APR-1999 (first entry)
Human iNOS peptide fragment PS-5295.
Human iNOS peptide fragment PS-5295.
Inductible, intric oxide synthase; iNOS; human; immunoassay; detection; monoclonal antibody; mimic; quantitation; sepsis; septic shock; lupus; myocardial infarction; tissue rejection; transplantation; psoriasis; autoimmune disease; multiple scierosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

```
inducible nitric oxide synthase (iNOS) or mimics of this protein is used to detect the presence of human iNOS protein in the sample. The method can be used for the detection and quantitation of human iNOS in cells and tissues for various pathophysical conditions such as sepsis, septic shock, myocardial infarction, rejection of tissue in organs following transplantation, monitoring "flare ups" in certain autolimune diseases such as lupus, psoriasis, and multiple sclerosis. This sequence in presents a peptide from human iNOS which is used in the method of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Detection of human inducible nitric oxide synthase - using an inducible nitric oxide synthase - using an entity reactive with human iNOS or mimics.

Example 4: Page 37: 93pp; English.

This invention describes an immunossay method where a sample with a specific binding entity (e.g. a monoclonal antibody) reactive to human inducible nitric oxide synthase (INOS) or mimics of this protein is used to detect the presence of human iNOS protein in the sample. The method can be used for the detection and quantitation of human iNOS in cells and tissues for various pathophysiclogical conditions such as sepsis, septic shock, myocardial infarction, rejection of tissue in organs following transplantation, monitoring "flare ups" in certain autofimmune diseases such as lupus, psoriasis, and multiple sclerosis. This sequence in presence in peptide from human iNOS which is used in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human iNOS peptide fragment PS-5227.
Inducible; nitric oxide synthase; iNOS; human; immunoassay; detection; monoclonal antibody; mimic; quantitation; sepsis; septic shock; lupus; myocardial infarction; tissue rejection; transplantation; psoriasis; autoimmune disease; multiple sclerosis.

Example 4: Fig 7C: 93pp: English.

This invention describes an immunoassay method where a sample with a specific binding entity (e.g. a monoclonal antibody) reactive to human inducible nitric oxide synthase (iNOS) or mimics of this protein is used to detect the presence of human iNOS protein in the sample. The method can be used for the detection and quantitation of human iNOS in cells and tissues for various pathophysiological conditions such as sepsis, septic shock, myocardial infarction, rejection of tissue in organs following transplantation, monitoring "flare ups" in certain autolimune diseases such as lupus, psoriasis, and multiple sclerosis. This sequence in persence of human iNOS which is used in the method of the

This invention describes an immunoassay method where a sample with a specific binding entity (e.g. a monoclonal antibody) reactive to human inducible nitric oxide synthase (iNOS) or mimics of this protein is used to detect the presence of human iNOS protein in the sample. The method can be used for the detection and quantitation of human iNOS in cells and tissues for various pathophysiological conditions such as sepsis, septic shock, myocardial infarction, rejection of tissue in organs following
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        30-APR-1999 (first entry)

Human iNOS peptide fragment PS-5226.

Inducible; nitric oxide synthase; iNOS; human; immunoassay; detection; monoclonal antibody; mimic; quantitation; sepsis; septic shock; lupus; myocardial infarction; tissue rejection; transplantation; psoriasis; autoimmune disease; multiple sclerosis.
30-APR-1999 (first entry)

Human 1NOS peptide fragment for epitope mapping #22.

Inducible, nitric oxide synthase; 1NOS; human; immunoassay; detection; monoclonal antibody; mimic; quantitation; sepsis; septic shock; lupus; myocardial infarction; tissue rejection; transplantation; psoriasis; autolmmune disease; multiple sclerosis; epitope mapping.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  100.0%; Score 33; DB 1; Length 12; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Detection of human inducible nitric oxide synthase - using an immunoassay in which a sample is contacted with a specific binding entity reactive with human iNOS or mimics.

Example 4; Fig 7C; 93pp; English.

This invention describes an immunoassay method where a sample with a specific binding entity (e.g. a monoclonal antibody) reactive to human inducible nitric oxide synthase (iNOS) or mimics of this protein is used can be used for the detection and quantitation of human iNOS in cells and tissues for various pathophysiclogical conditions such as sepsis, septic shock, myocardial infarction, rejection of tissue in organs following transplantation, monitoring "flare ups" in certain autoimmune diseases such as lupus, psoriasis, and multiple sclerosis. This sequence in presence in peptide from human iNOS which is used in the method of the
transplantation, monitoring "flare ups" in certain autoimmune diseases such as lupus, psoriasis, and multiple sclerosis. This sequence represents a peptide from human iNOS which is used in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             30-APR-1999 (first entry)

Human iNOS peptide fragment for epitope mapping #21.

Fundations, intric oxide synthase; iNOS; human; immunoassay; detection; endecible; nitric oxide synthase; iNOS; human; immunoation in mimic; quantitation; sepsis; septic shock; lupus; myocardial infarction; tissue rejection; transplantation; psoriasis; autoimmune disease; multiple sclerosis; epitope mapping.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      30-APR-1999 (first entry)
Human iNOS peptide fragment PS-5222.
Human iNOS peptide fragment PS-5222.
Inductble; nitric oxide synthase; iNOS; human; immunoassay; detection; monoclonal antibody; mimic; quantitation; sepsis; septic shock; lupus; myocardial infarction; tissue rejection; transplantation; psoriasis; autoimmune disease; multiple sclerosis.
Homo sapiens.

Detection of human inducible nitric oxide synthase - using an immunoassay in which a sample is contacted with a specific binding entity reactive with human iNOS or mimics.

Example 4: Page 36; 39pp; English.

This invention describes an immunoassay method where a sample with a specific binding entity (e.g. a monoclonal antibody) reactive to human inducible nitric oxide synthase (INOS) or mimics of this protein is used to detect the presence of human iNOS protein in the sample. The method can be used for the detection and quantitation of human iNOS in cells and tissues for various pathophysiological conditions such as sepsis, septic shock, myocardial infarction, rejection of tissue in organs following transplantation, monitoring "flare ups" in certain autoimmune diseases such as lupus, psoriasis, and multiple sclerosis. Detection of human inducible nitric oxide synthase - using an immunoassay in which a sample is contacted with a specific binding immunoassay in which human livos or mimics.

This invention describes an immunoassay method where a sample with a specific binding entity (e.g. a monoclonal antibody) reactive to human inducible nitric oxide synthase (iNOS) or mimics of this protein is used to detect the presence of human iNOS protein in the sample. The method can be used for the detection and quantitation of human iNOS in cells and tissues for various pathophysiological conditions such as sepsis, septic shock, myocardial infarction, rejection of tissue in organs following transplantation, monitoring "flare ups" in certain autoimnume diseases such as lupus, psoriasis, and multiple sclerosis. This sequence the presents a peptide from human iNOS which is used in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                Human 1NOS peptide fragment PS-5279.
Inducible; nitric oxide synthase; 1NOS; human; immunoassay; detection; monoclonal antibody; mimic; quantitation; sepsis; septic shock; lupus; myocardial infarction; tissue rejection; transplantation; psoriasis; autoimmune disease; multiple sclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                30-APR-1999 (first entry)
Human iNOS peptide fragment PS-5228.
Inducible; nitric oxide synthase; iNOS; human; immunoassay; detection; inducible; nitric oxide synthase; iNOS; human; sepsits shock; lupus; monoclonal antibody; mimic; quantitation; sepsis; septic shock; lupus; myocardial infarction; tissue rejection; transplantation; psoriasis; autoimmune disease; multiple sclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              87.9%; Score 29; DB 1; Length 8; 100.0%; Pred. The proof of the protein sub-unit - allows investigation of sub-unit sequence motif functions, for control of rapid cell division e.g. in cancer and cancer and cancer and cancer bage 3; 68pp; English.

Disclosure; Page 3; 68pp; English.

A cis-regulatory element required for virion associated protein vpl6 mediated induction of herpes simplex virus 1 (HSV1) immediate early (IE) genes consists of three imperfect repeats of the purine-rich hexanucleotide 5'-CGGAR-3'. A protein complex capable of avid interaction with the purine-rich repeats (GA repeats) has been identified in soluble preparations of rat liver nucleic. This GA binding protein (GABP) consists of two separable subunits.

C Applicants have isolated cDNA clones encoding both subunits of GABP and have revealed that one (GABP alpha) is related to the Ets cransforming protein, while the other (GABP beta) contains a series of 33-amino acid repeats related in sequence to a variety
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New transfer vector pBFs, for HIV diagnosis -
contg. promoter region of polyhedrin protein gene for slik-worm
nuclear polyhedrosis virus deoxyribonucleic acid
Figure 2; page 9; llpp; Japenese.
Transfer vectors pBFs were prepd. contg. promoter region of polyhedrin
protein gene of silkworm nuclear polyhedrosis virus (NPV) recombined
with HIV gene gag, pol, SOR, gpl20 or gp41 in the polylinker region
of the vector. Thus, HIV antigenic protein can be produced in large
amts, and used as an antigen for the diagnosis of HIV or for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  R33352;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Detection of fugan inducible nitric oxide synthase - using an immunoassay in which a sample is contacted with a specific binding immunoassay in which human iNOS or mimics.

The entity reactive with human iNOS or mimics.

Example 4; Fig 7C; 93pp; English.

This invention describes an immunoassay method where a sample with a specific binding entity (e.g. a monoclonal antibody) reactive to human inducible nitric oxide synthase (iNOS) or mimics of this protein is used to detect the presence of human iNOS protein in the sample. The method can be used for the detection and quantitation of human iNOS in cells and tissues for various pathophysiological conditions such as sepsis, septic shock, myocardial infarction, rejection of tissue in organs following transplantation, monitoring "flare ups" in certain autoimmune diseases such as lupus, psoriasis, and multiple sclerosis. This sequence the presents a peptide from human iNOS which is used in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

Human 1NOS peptide fragment for epitope mapping #23.

Inducible; nitric oxide synthase; 1NOS; human; immunoassay; detection; monoclonal antibody; mimic; quantitation; sepsis; septic shock; lupus; myocardial infarction; tissue rejection; transplantation; psoriasis; autoimmune disease; multiple sclerosis; epitope mapping.
                                                                                         Detection of human inducible nitric oxide synthase - using an immunoassay in which a sample is contacted with a specific binding entity reactive with human iNOS or mimics.

Example 4: Page 37: 93pp: Engilsh.

This invention describes an immunoassay method where a sample with a

munoassay in which a sample is contacted with a specific binding minoassay in which a sample is contacted with a specific binding entity reactive with human iNOS or mimics.

Example 4; Page 36; 93pp; English.

Example 4; Page 36; 93pp; English.

Chis invention describes an immunoassay method where a sample with a specific binding entity (e.g. a monoclonal antibody) reactive to human specific binding entity (e.g. a monoclonal antibody) reactive to human specific binding entity (e.g. a monoclonal antibody) reactive to human specific binding entity (e.g. a monoclonal antibody) reactive to human incomplex the presence of human iNOS protein in the sample. The method can be used for the detection and quantitation of human iNOS in cells and itserse for various pathophysiological conditions such as sepsis, septic shock, myocardial infarction, rejection of tissue in organs following transplantation, monitoring "flare ups" in certain autoimmune diseases such as lupus, psoriasis, and multiple sclerosis. Example 4: Fig 7B; 93pp; English.

Example 4: Fig 7B; 93pp; English.

This invention describes an immunoassay method where a sample with a specific binding entity (e.g. a monoclonal antibody) reactive to human inducible nitric oxide synthase (iNOS) or mimics of this protein is used to detect the presence of human iNOS protein in the sample. The method can be used for the detection and quantitation of human iNOS in cells and tissues for various pathophysiological conditions such as sepsis, septic shock, myocardial infarction, rejection of tissue in organs following transplantation, monitoring "flare ups" in certain autoimmune diseases such as lupus, psoriasis, and multiple sclerosis.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Progress, 1999, G2269,

Progress, 29-Jun-1999, G20-16094.

Candundan phage and a recognition site on the heterologous protein. The conditionated by context with strain of cells that do not express (I) to conditionated by context with strain of cells that do not express (I) to conditionated by context with strain of cells that do not express (I) to conditionated by context with strain of cells that do not express (I) to conditionated by context with strain of cells that do not express (I) to conditionated by context that bind proteins other than (I). The library is confidentially receptors. Peptides identified by screening with the conditionated by context by sections other than (I). The library is conditionated by context by useful as therapeutic and diagnostic conditionation eliminates much of the noise caused by binding to colls sequences can be used to design other agents for the same uses. The colls intra fractionation eliminates much of the noise caused by binding to colls in intrail fractionation eliminates much of the noise caused by binding to colls intrain colls.

Conferenting (these express a far greater number of (I) than wild-type contents in the sequence of transfected cells introves the signal-to-noise ratio. The number of rounds of correcting may thus be reduced.
                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

This peptide is an example of a peptide which binds to a human leucocyte antigen HIA-D04 molecule. The peptide was isolated from a phagemid combinatorial library comprising the sequence V05953, by screening with
represents a peptide from human iNOS which is used in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New transfer vector pBFs, for HIV diagnosis -
confg. promoter region of polyhedrin protein gene for slik-worm
nuclear polyhedrosis virus deoxyribonucleic acid
Figure 2; page 9; llpp; Japanese.
Transfer vectors pBFs were prepd. confg. promoter region of polyhedrin
protein gene of silkworm nuclear polyhedrosis virus (NPV) recombined
with HIV gene gag, pol, SOR, gpl20 or gp41 in the polylinker region
of the vector. Thus, HIV antigenic protein can be produced in large
amts. and used as an antigen for the diagnosis of HIV or for
vaccine production.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        03-MAY-1995 (first entry)
CENP-B protein amino acids 473-477, homologous to HSV-1 IE motif.
CENP-B protein; centromere protein; epitope, autoantibody; immunoinfective cluster virus; nuclear protein antigen; systemic rheumatic disorder; herpes simplex virus; HSV-1 IE; immediate early protein; systemic lupus erythematosus; scleroderma.
virus (FMDV) nonstructural protein which are immunoreactive with FMDV-specific antibodies or T cells and can be used in vaccines against the disease. The vaccines are used especially for immunising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

NOVED POLYPEPTIME PETROCHEMICAL CO LTD.
NOVED POLYPEPTIME STATEMENT AND A STATEMENT TSH receptor antibody - used in detection of the TSH antibody.
Example 1; Page 25; 54pp; Japanese.
Peptides with affinity to human TSH (thyroid stimulating hormone) receptor antibody are used for detection of the antibody. (See also R73201-592).

Production of biotinylated proteins by expression of a Production of biotinylated proteins by expression of a recombinant DNA vector - which encodes a fusion protein comprising a protein and a blotinylated peptide.

Claim 10; Page 136; 146pp; English.

Claim 10; Page 136; 146pp; English.

A library of small, efficient peptide biotinylation sequences (R65048-66) was generated by using a generic peptide (R65047) and a system known as the "peptides on plasmids" system. At some positions in the sequences, on clear consensus is apparent. At other residues, however, clear trends emerge. A protein can be biotinylated by constructing a recombinant DNA expression vector encoding a fusion protein, comprising a protein and a biotinylation peptide. A host cell, eg. E. coli is transformed with the vector and is cultured in the presence of biotin and a biotinylation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           FGF9 antigenic peptide, SP32.

FGF9 antigenic peptide, SP32.

FGF9 antigenic peptide, SP32.

Mouses chicken; fibroblast growth factor 9; FGF9; detection;

Mouses chicken; fibroblast growth factor receptor 3; FGFR3; cartilage repair;

W pibroblast growth factor receptor 3; FGFR3; cartilage repair;

W pone repair; antigonist; anti-FGF9 antibody; endochondromas;

Solitary hereditary exostosis; multiple hereditary exostosis;

W hallux valgus deformity; achondroplasia; synovial chondromatosis.

The sequence of the mouse anti-human interleukin-6 (IL-6) antibody heavy chain variable region framework region (FR) 4. The sequences of FR1-4 (R77215-8) were used in conjunction with the complementarity determining regions 1-3 (R77212-4) to construct a chimaeric antibody against human interleukin-6 (IL-6). The vectors Q75914-7 express constructs encoding fragments of a chimaeric antibody to the human IL-6 comprising (a) a light chain with (i) a variable region containing 3 CDR (R77201-3) inserted into several framework regions (FR) (T77204-7) and (ii) a human light chain constant region and (b) a heavy chain with (i) a variable region containing 3 CDR (R77212-4) inserted into FR (K77215-8) and (ii) a human light chain constant region. The FR of the light chain may be mouse derived (Q75889) or from the human antibody DAW.

The antibodies can be used in the treatment of IL-6 related disorders. The antibodies are useful as they have low antigenicity due to the use of human derived sequences and low antigenicity mouse derived sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

Example 1; Page 25; 54pp; Japanese.

Peptides with affinity to human TSH (thyroid stimulating hormone) receptor antibody are used for detection of the antibody. (See also R73201-592).
                                                                                                                                                    12-DEC-1995 (first entry)

P is a peptide containing a protease binding site, e.g. W46520-53. F1 and F2 are fluorophores. S1 and S2 are fluorophores. S1 and S2 are peptide spacers e.g. W46554-58. n, k=0 or 1. C1 and C2 are conformation-determining regions that introduce a bend into the composition which positions the fluorophores adjacent to each other with a separation of less than 100 Angstrom. When n is 1, S1 is joined to the terminal alpha -amino group of C1 by a peptide bond, and when k is 1, S2 is joined to the terminal carboxy group
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Fluorogenic substrates for protease determination - having two closely spaced fluorophores flanking protease binding site Disclosure. Column 4: 39pp; English. Peptides W46520-53 contain protease binding sites. They are used to produce novel reagents whose fluorescence increases in the presence of particular proteases. These fluorogenic protease indicators (substrates) provide a high intensity fluorescent signal at a visible wavelength when they are digested by a protease. The fluorogenic indicators have the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      20-MAY-1998 (first entry)
Peptide containing a protease binding site.

Peptide is one of several fragments from gp 120 and gp41 (env gene) p18 and p24 (gag gene), p32 (pol gene) and proteins encoded by the tat, orf trs/art and sor genes. They are used for detecting, inhibiting and neutralising HIV-1 infection. Dosage is pref. 5-25 mg/Kg. The peptides can be used for any type of immunological detection esp. dot blot and ELISA.

                Example 1; Page 7: 32pp; English.

The sequences given in Wils49-50 represent antigenic peptide fragments of fibroblast growth factor 9 (FGF9) which were used in the production of anti-FGF9 antibodies. FGF9 is used in the method of the invention of actisme. The method comprises contacting the sample or tissue with FGF9, allowing formation of receptor-ligand pairs, and detecting any FGFR3 reGF9 pairs. Compositions containing FGF9 can be used to increase FGFR3 FGF9 pairs. Compositions containing FGF9 can be used to increase FGFR3 FGF9 antagonists or FGF9 binding agents (e.g. anti-FGF9 antibodies) can be used to treat diseases caused by an excess of FGF9 antibodies or versactivity of FGFR3, esp. multiple or solitary hereditary exostosis, hallur valgus deformity, achondroplasla, synovial chondromatosis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Peptide(s) that can be biotinylated by biotin ligase - and fusion proteins containing them
Column 5. Column 66; 35pp. English.

Peptides W46651-69 are non-naturally occurring biotinylation peptides, derived from a library constructed to express peptides of the generic sequence W46650. The library was constructed using oligonuclecties V16121-23. The peptides contain a biotinylatable sequence motif, recognised by a biotinylation enzyme, e.g. biotin-protein ligase (BirA). The C or N terminus of the peptides can be covalently coupled to a protein that is incapable of being biotinylated by a biotin ligase. The peptides can be biotinylated in vitro or in vivo, especially with BirA biotin ligase, and used for the purification, immobilisation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            W46652;

Gaps

of C2 by a peptide bond. The protease indicators are used for detecting protease activity in a biological sample. The sample is contacted with the indicator and any change in fluorescence is detected, an increase in fluorescence indicating protease activity. នួននួន

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  RESULT 2
S50900
Including protein Lhcb5 - spinach (fragment)
N.Alternate names: light-harvesting complex LHCIIC protein
C;Species: Spinacia oleracea (spinach)
C;Species: Spinacia oleracea (spinach)
C;Species: Spinacia oleracea (spinach)
C;Accession: S50900
R;Walters, R.G.; Ruban, A.V.; Horton, P.
Eur. J. Biochem. 226, 1063-1069, 1994
A;Title: Higher plant light-harvesting complexes LHCIIa and LHCIIc are bound by dicycloh
A;Reference number: S50900; MUID:95112835
A;Accession: S50900
                                                                                                           Fructose-bisphosphate aldolase (EC 4.1.2.13) - fungus (Fusarium sporotrichioides) (fragm C; Species: Fusarium sporotrichioides
C; Species: Pusarium sporotrichioides
C; Date: 20-Feb-1995 #sequence_revision 20-Feb-1995 #text_change 20-Feb-1995

RESULT 21
461483
pyridoxal kinase (EC 2.7.1.35) - sheep (fragment)
C;Species: Ovis orientalis arises, Ovis ammon aries (domestic sheep)
C;Deccies: Ovis orientalis arises, Ovis ammon aries (domestic sheep)
C;Date: 07-OCT-1994 #sequence_revision 07-OCT-1994 #text_change 07-OCT-1994

A;Title: Cleavage of pyridoxal kinase into two structural domains: kinetics of proteon A;Reference number: A61483
A;Accession: A61483
A;Acces
                                                                                                                                                                             A Accession: A01254
A Molecule type: protein
A; Molecule type: protein
A; Residues: 1-11 < KAT>
A; Note: the sequence of the natural peptide was confirmed by the synthesis and analys
C; Superfamily: bradykinin-roptentiating peptide
C; Superfamily: bradykinin-roptentiating enzyme inhibitor; bradykinin; pyroglutamic acid; v
F; 1/Modified site: pyrrolidone carboxylic acid (Gln) #status experimental
C;Species: Agkistrodon blomhoffi (mamushi)
C;Date: 13-Jul-1981 #sequence_revision 13-Jul-1981 #text_change 08-Dec-1995
C;Accession: A01254

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Description
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         P32118

"Amino acid sequence of bradykinin-potentiating peptide isolated from
"Amino acid sequence of bradykinin-potentiating peptide isolated from
the venom of Apkistrodon halys blomhoffil.";

Proc. Jpn. Acad., B. Phys. Biol. Sci. 46:176-181(1970).

-!- FUNCTION: THIS PEPTIDE BOTH INHIBITS THE ACTIVITY OF THE
ANGIOTENSININ-CONVERFING ENZYME AND ENHANCES THE ACTION OF
BRADYKININ BY INHIBITING THE KINASES THAT INACTIVATE IT.

IT ACTS AS AN INDIRECT HYPOTENSIVE AGENT.
                                                                                                                                                                                                                                                                                                   Muren J.E., Naessel D.R.; "Isolation of five tachykinin-related peptides from the midgut of the cockroach Leucophaea madera: existence of N-terminally extended isoforms.";

Rat liver pp49, a protein that forms complexes with protein kinase

"Rat liver pp49, a protein that forms complexes with protein kinase

"T CK2, is composed of the beta and the gamma subunits of translation

initiation factor eIF-2.";

Biochem. Biophys. Res. Commun. 225:1052-1057(1996).

COMPLEX BIONS RES. COMPLEX WITH GTP AND INITIATOR TRNA. THIS

COMPLEX BINDS TO A 40S RIBOSOMAL SUBUNIT, FOLLOWED BY MRNA BINDING

COMPLEX BINDS TO A 40S RIBOSOMAL SUBUNIT, FOLLOWED BY MRNA BINDING

COMPLEX BINDS TO A 40S RIBOSOMAL SUBUNIT, FOLLOWED BY MRNA BINDING

COMPLEX BINDS TO A 40S RIBOSOMAL SUBUNIT, FOLLOWED BY MRNA BINDING

COMPLEX BINDS TO A 40S RIBOSOMAL SUBUNIT, FOLLOWED BY MRNA BINDING

COMPLEX SINDS TO A 40S RIBOSOMAL SUBUNIT, FOLLOWED BY MRNA BINDING

COMPLEX SUBUNIT TO FORM THE 80S INITIATION COMPLEX IS PRECEDED BY

HYDROLYSIS OF THE GTP BOUND TO EIF-2 AND RELEASE OF AN EIF-2-GDP

BINARY COMPLEX. IN ORDER FOR EIF-2 TO RECYCLE AND CATALYZE ANOTHER

ROUND OF INITIATION, THE GDP BOUND TO EIF-2 WUST EXCHANGE WITH GTP

BY WAY OF A REACTION CATALYZED BY EIF-2B.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                SUBUNIT: HETEROTRIMER COMPOSED OF AN ALPHA, A BETA, AND A GAMMA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          MEDLINE; 96087879.
